

Computerized Tests

Completed via Technician Monitored Programs

1. Computerized Body Scan:

This 15-20 min. computerized test scans over 9000 items of the body, including vitamin and mineral deficiencies, food and environmental allergens, toxicities, parasites, fungi, all organs, muscle function, hormonal function, emotional, blockage, mental stress.....and so much more.

2. Cardiac Screening Test:

The Cardio DM-06 is a new computer analyzed ECG screening device that uses a dispersion mapping method to detect heart disease BEFORE life altering symptoms appear. It uses traditional ECG signals as a way of capturing low amplitude oscillations of surface potentials during the particular PQRST cardio cycle intervals. It is intended for a quick identification of heart performance abnormalities.

3. Bone Density Test: This test is done on the ankle bone (cancellous bone is 8x more metabolically active than cortical) and uses quantitative ultrasound (QUS) to measure bone mass, structure and elasticity.

4. Arterial Stiffness Index (ASI): This test measures the elasticity and flexibility of the blood vessels - this is important in determining blockages and cardiovascular disease.

5. Peripheral Visual Field Test: This test is like an eye exam but is computerized. It measures peripheral vision for detecting early signs of ocular disorders before they affect central vision. It is also used for monitoring the effectiveness of eye-therapy regimes.

6. Body Composition Test: This test measures the BMR (Basal Metabolic Rate), Body Fat Percentage and the Body Mass Index (BMI) to obtain current health status, the body fat percentage, the strength and speed of electrical signals and the conduction of different body tissues. This test is necessary to determine an individual's body fat, lean body mass and body hydration levels.
